

PHASE 1 – BRAINSTORMING & IDEATION

1.1 Introduction

The brainstorming and ideation phase focuses on identifying the challenges involved in traditional blog creation and developing a technology-based solution to simplify the content creation process.

The project team identified the need for a centralized blogging platform that could combine content management capabilities with Artificial Intelligence. The proposed solution, AI BlogNest, is designed to assist users in creating, managing, organizing, and consuming blog content through a secure backend system.

1.2 Problem Identification

Traditional blogging systems may require users to manually create content, organize posts, manage categories, moderate comments, and maintain different stages of publication.

The major challenges identified were:

- Time-consuming manual blog creation.
- Difficulty managing multiple blog posts.
- Lack of automated content generation.
- Difficulty organizing categories and tags.
- Manual comment management.
- Limited role-based access control.
- Difficulty summarizing lengthy content.
- Requirement for secure user authentication.

1.3 Proposed Idea

The proposed idea is to develop an AI-powered backend platform called AI BlogNest.

The system provides REST API services for blog management and integrates Google Gemini AI to support intelligent content-generation features.

The platform combines conventional Content Management System capabilities with Generative AI to provide an efficient content creation workflow.

1.4 Objectives

The major objectives of AI BlogNest are:

- To simplify the process of creating blog content.
- To provide AI-assisted blog generation.

- To manage users and their access permissions.
- To provide secure authentication and authorization.
- To organize blogs using categories and tags.
- To manage comments efficiently.
- To provide AI-assisted content summarization.
- To maintain blog data using MongoDB.
- To provide scalable REST API services.
- To reduce the manual effort required for content creation.

1.5 Expected Outcome

The expected outcome is a secure and modular backend platform capable of managing blog-related operations while providing AI-based assistance for content generation and summarization.
